## News Release

### SIGNIFICANT INCREASE IN ODYSSEUS HIGH GRADE NICKEL RESOURCES AND UPGRADED DISSEMINATED INDICATED MINERAL RESOURCES

Western Areas Ltd (ASX: WSA, "Western Areas" or the "Company") is pleased to announce that the Company has trebled the defined high grade Massive Sulphide Mineral Resource at the Cosmos Odyssey Project ("Project" or "Odyssey"). A significant percentage of the Disseminated Inferred Mineral Resource at the Project has also been upgraded to the Indicated category providing increased confidence and flexibility in the Definitive Feasibility Study that is currently underway (Table 1).

Key highlights from the Mineral Resource update include:

- ✓ A 311% increase in the Total Massive Sulphide Resource to 22,838 nickel tonnes grading 8.4% Ni which now includes 8,836 nickel tonnes grading 6.1% Ni in the Indicated category;
- ✓ A 78% increase in the Odyssey North disseminated Indicated Resource to 81,156 nickel tonnes grading 2.6% Ni (previously 45,519 nickel tonnes grading 2.8% Ni);
- ✓ An overall increase in the Indicated to Inferred disseminated resource ratio from 77% to 94%, which includes a ratio increase of 56% to 93% in Odyssey North disseminated;
- ✓ The increase in Indicated Resource provides greater flexibility to the proposed mine design and schedule of the Definitive Feasibility Study; and
- ✓ The Total Odyssey Mineral Resource Estimate now stands at 7.9Mt @ 2.5% Ni for 199,174 nickel tonnes at a cut-off of 1.5% Ni.

Western Areas Managing Director, Dan Lougher, said that it was pleasing to tick off another milestone for the Odysseus Project at Cosmos.

“The increase in the confidence level of the resources at Odysseus was one of the critical path items for the timely completion of the project DFS, and will support the definition of an Ore Reserve for the project. The amount of massive sulphides included from limited drilling and the increase in total nickel tonnes was above our expectation when we completed due diligence on this acquisition,” Mr Lougher said.

“We are also pleased to advise that Piran Mining has been appointed as Project Manager for the DFS and has already commenced work. Piran Mining was Project Manager for the Spotted Quoll feasibility study which has turned into one of the great success stories for underground mining in Western Australia. Piran is well versed in the quality controls and high technical expectations driven by the Western Areas team, which was an important factor in making this appointment,” Mr Lougher said.

**CP STATEMENT:**

The information within this report as it relates to Mineral Resources is based on information compiled by Mr Andre Wulfse. Mr Wulfse is a Fellow of AusIMM and a full time employee of Western Areas. Mr Wulfse has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves.' Mr Wulfse consents to the inclusion in the report of the matters based on the information in the context in which it appears.

**FORWARD LOOKING STATEMENT:**

This release contains certain forward-looking statements including nickel production targets. Often, but not always, forward looking statements can generally be identified by the use of forward looking words such as "may", "will", "expect", "intend", "plan", "estimate", "anticipate", "continue", and "guidance", or other similar words and may include, without limitation, statements regarding plans, strategies and objectives of management, anticipated production and expected costs.

Examples of forward-looking statements used in this release include: "the Disseminated Inferred Mineral Resource at the Project has also been upgraded to the Indicated category providing increased confidence and flexibility in the Definitive Feasibility Study".

These forward-looking statements are subject to a variety of risks and uncertainties beyond the Company's ability to control or predict which could cause actual events or results to differ materially from those anticipated in such forward-looking statements.

This announcement does not include reference to all available information on the Company or the Cosmos Nickel Complex and should not be used in isolation as a basis to invest in Western Areas. Any potential investors should refer to Western Area's other public releases and statutory reports and consult their professional advisers before considering investing in the Company.

For Purposes of Clause 3.4 (e) in Canadian instrument 43-101, the Company warrants that Mineral Resources which are not Mineral Reserves do not have demonstrated economic viability.

## JORC 2012 TABLE 1 – Odysseus Mineral Resource Estimate

### Section 1: Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> </ul>	<ul style="list-style-type: none"> <li>Targets were sampled using Diamond drilling, and holes were typically drilled perpendicular to the strike (north-south) of the stratigraphy, at angles ranging between 55° and 80°.</li> <li>Drill holes were located initially with hand held GPS and later surveyed by differential GPS. Each sample was submitted to ALS laboratories at Malaga, Perth and was weighed to determine density by the weight in air, weight in water method. All sampling was conducted under WSA QAQC protocols which are in accordance with industry best practice.</li> <li>Diamond drill core (NQ2) is ¼ core sampled on geological intervals (0.2m to 1.5m) to achieve sample weights under 2kgs. Samples were crushed, dried and pulverised (total prep) to produce a sub sample for analysis by 4 acid digest with an ICP/AES and FA/ICP (Au, Pt, Pd) finish.</li> </ul>
	<ul style="list-style-type: none"> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> </ul>	<ul style="list-style-type: none"> <li>All samples were prepared and assayed by independent commercial laboratories whose instruments are regularly calibrated</li> <li>Geophysical survey QC parameters were reviewed by an independent supervising geophysicists from Newexco Services Pty Ltd</li> </ul>
	<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>Diamond core is typically marked at 1m intervals</li> <li>Sample intervals are marked up by geologists based on geology</li> <li>Sampled mineralisation intervals are sent to a commercial laboratory for crushing and grinding before assaying.</li> </ul>
Drilling techniques	<ul style="list-style-type: none"> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Diamond drilling comprises HQ and NQ2 sized core.</li> <li>Core is oriented using the Boart Longyear TruCore orientation system</li> </ul>
Drill sample recovery	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>Diamond core recoveries have been logged and recorded in the database</li> <li>Diamond core is logged and recorded in the database. Overall recoveries are &gt;95% and there were no core loss issues or significant sample recovery problems. Core loss is noted where it occurs</li> <li>Diamond core was reconstructed into continuous runs on an angle iron cradle for orientation marking. Depths are checked against the depth given on the core blocks and rod counts are routinely carried out by the drillers.</li> </ul>
Logging	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> </ul>	<ul style="list-style-type: none"> <li>All geological logging was carried out to a high standard using well established nickel host rock and wall rock geology codes in using spreadsheets with appropriate spreadsheet templates as a guide.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> </ul>	<ul style="list-style-type: none"> <li>Final logging is quantitative and core photography is done to a high standard in both dry and wet form.</li> </ul>

		<p>previous estimate by;</p> <ul style="list-style-type: none"> <li>○ &gt;3,000m of surface diamond drilling</li> <li>○ Downhole geophysics</li> <li>○ A pre-feasibility study including metallurgical and geotechnical studies</li> <li>○ An extensive independent structural modeling study</li> <li>○ Mineral Resource and Geologic remodeling using the additional data whilst cross referencing and maintaining some of the assumptions (including grade zone cut-offs) used by the previous Competent Person</li> </ul>
	<ul style="list-style-type: none"> <li>• Nature of the data used and of any assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>• Current and historic exploration data previously reported by WSA and Xstrata was used for this estimate. All material assumptions are summarized in this Table and in the report</li> </ul>
	<ul style="list-style-type: none"> <li>• The effect, if any, of alternative interpretations on Mineral Resource estimation.</li> </ul>	<ul style="list-style-type: none"> <li>• Several alternative iterations of the mineralized and lithological models were generated and critically assessed during this study. The most appropriate model was then used as a base case for mineral resource estimation.</li> <li>• Several alternative iterations of grade estimations using linear and non linear techniques were completed and critically assessed before finalizing the MRE</li> <li>• At all stages of the process, were the models compared to the previously reported models to ensure an appropriate level of consistency between the previous and the current interpretation</li> </ul>
	<ul style="list-style-type: none"> <li>• The use of geology in guiding and controlling Mineral Resource estimation.</li> </ul>	<ul style="list-style-type: none"> <li>• Geology is the overriding influencing factor in this MRE. A robust digital geologic model forms the basis of the MRE.</li> </ul>
	<ul style="list-style-type: none"> <li>• The factors affecting continuity both of grade and geology.</li> </ul>	<ul style="list-style-type: none"> <li>• Grade and geometry continuity is primarily influenced by intrusive late stage barren pegmatite dykes which penetrate the host ultramafic rocks and crosscut mineralisation in some locations. These pegmatites have been carefully modeled using implicit and explicit techniques. The grade was interpolated across the late stage pegmatite boundaries and then the areas bounded by pegmatites were blocked out with zero grades. The figure below shows the resultant effect where the areas affected by the pegmatites are barren but the overall continuity of the grade shells (low grade=green) is maintained.</li> </ul> <div data-bbox="922 1534 1398 1809" style="text-align: center;"> </div>

## WESTERN AREAS

Dimensions	<ul style="list-style-type: none"> <li>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</li> </ul>	<ul style="list-style-type: none"> <li>The strike length of the Odysseus South deposit is approximately 350m. The largest distance from the top of the mineralisation to the base is approximately 225m. The width of the deposit varies between 0.8m to 68m averaging 27m. Average grade and thickness increases down plunge to the north.</li> <li>The strike length of the Odysseus North deposit is approximately 325m. The largest distance from the top of the mineralisation to the base is approximately 340m. The width of the deposit varies between 0.8m to 71m averaging 28m (5m cut off). Average grade and thickness increases to the north.</li> </ul>
Estimation and modeling techniques	<ul style="list-style-type: none"> <li>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, method was chosen include a description of computer software and parameters used and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</li> </ul>	<ul style="list-style-type: none"> <li>The estimation was done using the following main software packages;                             <ul style="list-style-type: none"> <li>Leapfrog Geo Version 4.0.1</li> <li>Datamine Studio RM Version 1.2.47.0</li> <li>Snowden Supervisor Version 8.6</li> </ul> </li> <li>Wireframing of grade and geological domains using underground and surface drilling was completed in Datamine and Leapfrog.</li> <li>Sample data was composited to 1m downhole lengths and flagged on domain codes generated from 3D mineralized wireframes and 3D lithological wireframes.</li> <li>Directional variography was performed for the Ni and density data for each of the domains using Snowden Supervisor software.</li> <li>All estimation was completed at the parent cell scale to avoid any potential geostatistical support issues.</li> <li>Top cut investigations were completed and no top cuts were applied during estimation. Low and high grade Ni domains were used instead.</li> </ul>
	<ul style="list-style-type: none"> <li>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</li> </ul>	<ul style="list-style-type: none"> <li>This 2017 MRE is the seventh resource estimate for the Odysseus Disseminated Nickel Sulphide Deposit.</li> <li>The resource model volumetrics were compared to the previous model and variances can be explained due to the additional drilling and modeling techniques.</li> <li>No mine data exists for the Odysseus deposits</li> <li>Estimation validation techniques included visual comparison of the composites and estimated blocks, graphs of pass number versus % filled, swathe plots of the composite grades vs the grade of the block model, and swathe plots of kriging variance, kriging efficiency and slope of regression.</li> <li>Non linear estimation techniques (Conditional Simulation) was used as an additional validation technique to validate the resource</li> </ul>
	<ul style="list-style-type: none"> <li>The assumptions made regarding recovery of by-products.</li> </ul>	<ul style="list-style-type: none"> <li>Ni is currently considered the only economic product that will be recovered</li> </ul>
	<ul style="list-style-type: none"> <li>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</li> </ul>	<ul style="list-style-type: none"> <li>The ratio of Fe to Mg is recognized as influencing standard Ni flotation mill recoveries and both elements have been interpolated into the block model and the ratio has been calculated for each parent block in preparation for further metallurgical work.</li> <li>All variables that have &gt;1,000 assays out of a possible 4,500 assays have been estimated into the model, these are:</li> <li>Fe, Mg, As, Co, Cr, Cu, S, Zn, MgO, Fe<sub>2</sub>O<sub>3</sub></li> </ul>

## WESTERN AREAS

	<ul style="list-style-type: none"> <li>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</li> </ul>	<ul style="list-style-type: none"> <li>A proto model was constructed using parent blocks of 10 mE x 15 mN x 5 mRL and sub-blocked to 1.25m x 2.5m x 1.25m.</li> <li>Drillhole spacing ranges from 22m to 76 m, averaging 50 m.</li> <li>The size of the search ellipse was based on the Ni variography for each domain. Three search passes were used and the search ellipses varied for each of the 13 mineralized domains</li> <li>A maximum number of samples from any particular borehole were set at 30 and 36 depending on the Domain. This prevents a disproportionate number of samples from any borehole having an undue influence on the estimate.</li> </ul>
	<ul style="list-style-type: none"> <li>Any assumptions behind modeling of selective mining units.</li> </ul>	<ul style="list-style-type: none"> <li>No assumptions were made other than that the mineralisation in the disseminated is zoned and the outer low grade shell may not make it into the reserve category after an appropriate reserve cut-off has been applied.</li> </ul>
	<ul style="list-style-type: none"> <li>Any assumptions about correlation between variables.</li> </ul>	<ul style="list-style-type: none"> <li>No correlation between geochemical elements was observed.</li> </ul>
	<ul style="list-style-type: none"> <li>Description of how the geological interpretation was used to control the resource estimates.</li> </ul>	<ul style="list-style-type: none"> <li>Mineralised zones were digitised using explicit and implicit techniques by WSA and independent Geologists</li> <li>Polygons were snapped to both underground and surface drilling intercepts. Each wireframe is representative of a grade domain, and used in compositing and estimating to ensure high grades were not smeared into the low grade zones and vice versa.</li> </ul>
	<ul style="list-style-type: none"> <li>Discussion of basis for using or not using grade cutting or capping.</li> </ul>	<ul style="list-style-type: none"> <li>Top cut investigations were completed and no top cuts were applied during estimation. Low and high grade Ni domains were used instead.</li> </ul>
	<ul style="list-style-type: none"> <li>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</li> </ul>	<ul style="list-style-type: none"> <li>Estimation validation techniques included visual comparison of the composites and estimate blocks, graphs of pass number versus % filled, swathe plots of the composite grades vs the grade of the block model, and swathe plots of kriging variance, kriging efficiency and slope of regression</li> </ul>
Moisture	<ul style="list-style-type: none"> <li>Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.</li> </ul>	<ul style="list-style-type: none"> <li>Tonnages were estimated on a dry basis.</li> </ul>
Cut-off parameters	<ul style="list-style-type: none"> <li>The basis of the adopted cut-off grade(s) or quality parameters applied.</li> </ul>	<ul style="list-style-type: none"> <li>The resource is reported above 1.5% Ni cut off grades for all mineralized material and a minimum true thickness of 1.5m for Massive sulphides</li> </ul>
Mining factors or assumptions	<ul style="list-style-type: none"> <li>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>Standard paste fill longhole mining is assumed for the disseminated material and jumbo operated room and pillar for the massive sulphide material</li> </ul>

## WESTERN AREAS

Metallurgical factors or assumptions	<ul style="list-style-type: none"> <li>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>Ni flotation mill recovery techniques are assumed for both the disseminated and massive sulphide material</li> </ul>
Environmental factors or assumptions	<ul style="list-style-type: none"> <li>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>Potential waste and process residue disposal sites have been identified during a pre feasibility study and are not going to deviate much from previous sites using during past open cast and underground mining at Cosmos.</li> </ul>
Bulk density	<ul style="list-style-type: none"> <li>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</li> </ul>	<ul style="list-style-type: none"> <li>Bulk densities are determined using the same independent commercial laboratories as discussed in previous sections.</li> </ul>
	<ul style="list-style-type: none"> <li>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</li> </ul>	<ul style="list-style-type: none"> <li>All data used in the MRE is from competent fresh rock and void spaces are not material</li> </ul>
	<ul style="list-style-type: none"> <li>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</li> </ul>	<ul style="list-style-type: none"> <li>Bulk densities are determined for each sample assayed and interpolated into the block model</li> </ul>
Classification	<ul style="list-style-type: none"> <li>The basis for the classification of the Mineral Resources into varying confidence categories.</li> </ul>	<ul style="list-style-type: none"> <li>Resource classification is based on a combination of Geological knowledge and confidence in the interpretation, data distribution, estimation passes, Kriging Efficiency (KE) and Slope of Regression (Slope) data analysis.</li> <li>The Odysseus deposit is classified as JORC Indicated and Inferred. No blocks were classified as Measured</li> </ul>
	<ul style="list-style-type: none"> <li>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, and confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</li> </ul>	<ul style="list-style-type: none"> <li>The definition of mineralised zones is based on a high level of geological understanding. It is believed that all relevant factors have been considered in this estimate, relevant to all available data.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether the result appropriately reflects the Competent Person's view of the deposit.</li> </ul>	<ul style="list-style-type: none"> <li>The MRE reflects the Competent Person's view of the deposit and the risks associated with the grade and structural continuity.</li> </ul>
Audits or reviews	<ul style="list-style-type: none"> <li>The results of any audits or reviews of Mineral Resource estimates.</li> </ul>	<ul style="list-style-type: none"> <li>The MRE has not been independently audited or reviewed in its entirety. Independent Consultants have been involved in the modeling process to varying degrees.</li> </ul>

## WESTERN AREAS

Discussion of relative accuracy/confidence	<ul style="list-style-type: none"><li>• Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</li></ul>	<ul style="list-style-type: none"><li>• Conditional Simulation techniques were used to determine the relative accuracy of Odysseus South within stated confidence limits and the results indicated that the global grade is very robust (within 0.05% variance) using 36 simulations.</li></ul>
	<ul style="list-style-type: none"><li>• The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</li></ul>	<ul style="list-style-type: none"><li>• The MRE Statement relates to local estimates</li></ul>
	<ul style="list-style-type: none"><li>• These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</li></ul>	<ul style="list-style-type: none"><li>• The Odysseus deposit has not been mined but estimates have been compared against previous estimates and the overall geometry and global grades are consistent.</li></ul>
